Principle of measurement

The basic principle is a direct measurement of the temperature of dew point. A Peltier cooler is used to cool the sensor tip down to the point at which moisture condenses on the measuring surface. This condensation is detected, and the resulting temperature is output as the dew point after a system-specific conversion. The system of heat sink heat pipes and Peltier cooler allows measurements up to the maximum process temperature of 250 °C.

Measuring range

* If the dew point temperature in the process chamber is lower than in the environment, this leads to internal condensation in the sensor. Continued operation under such conditions can damage the sensor.

** Higher ambient temperatures on the heat sink lead to higher minimum measurable dew point temperatures.
